*Long Term Maintenance and Monitoring  
Semi-Annual Surface Water Quality Monitoring Program July 2016 Final Report*

Surface water quality monitoring has been implemented as part of the long term maintenance and monitoring (LTMM) program to provide ongoing data and compliance commitments to regulatory agencies and/or stakeholders. Nova Scotia Lands Incorporated (NS Lands) is a Crown Corporation of the Province of Nova Scotia responsible for the LTMM semi-annual surface water quality program. NS Lands retained Dillon Consulting Limited (Dillon) to conduct the July 2016 LTMM Surface Water Quality Monitoring Program, the details of which are provided herein.

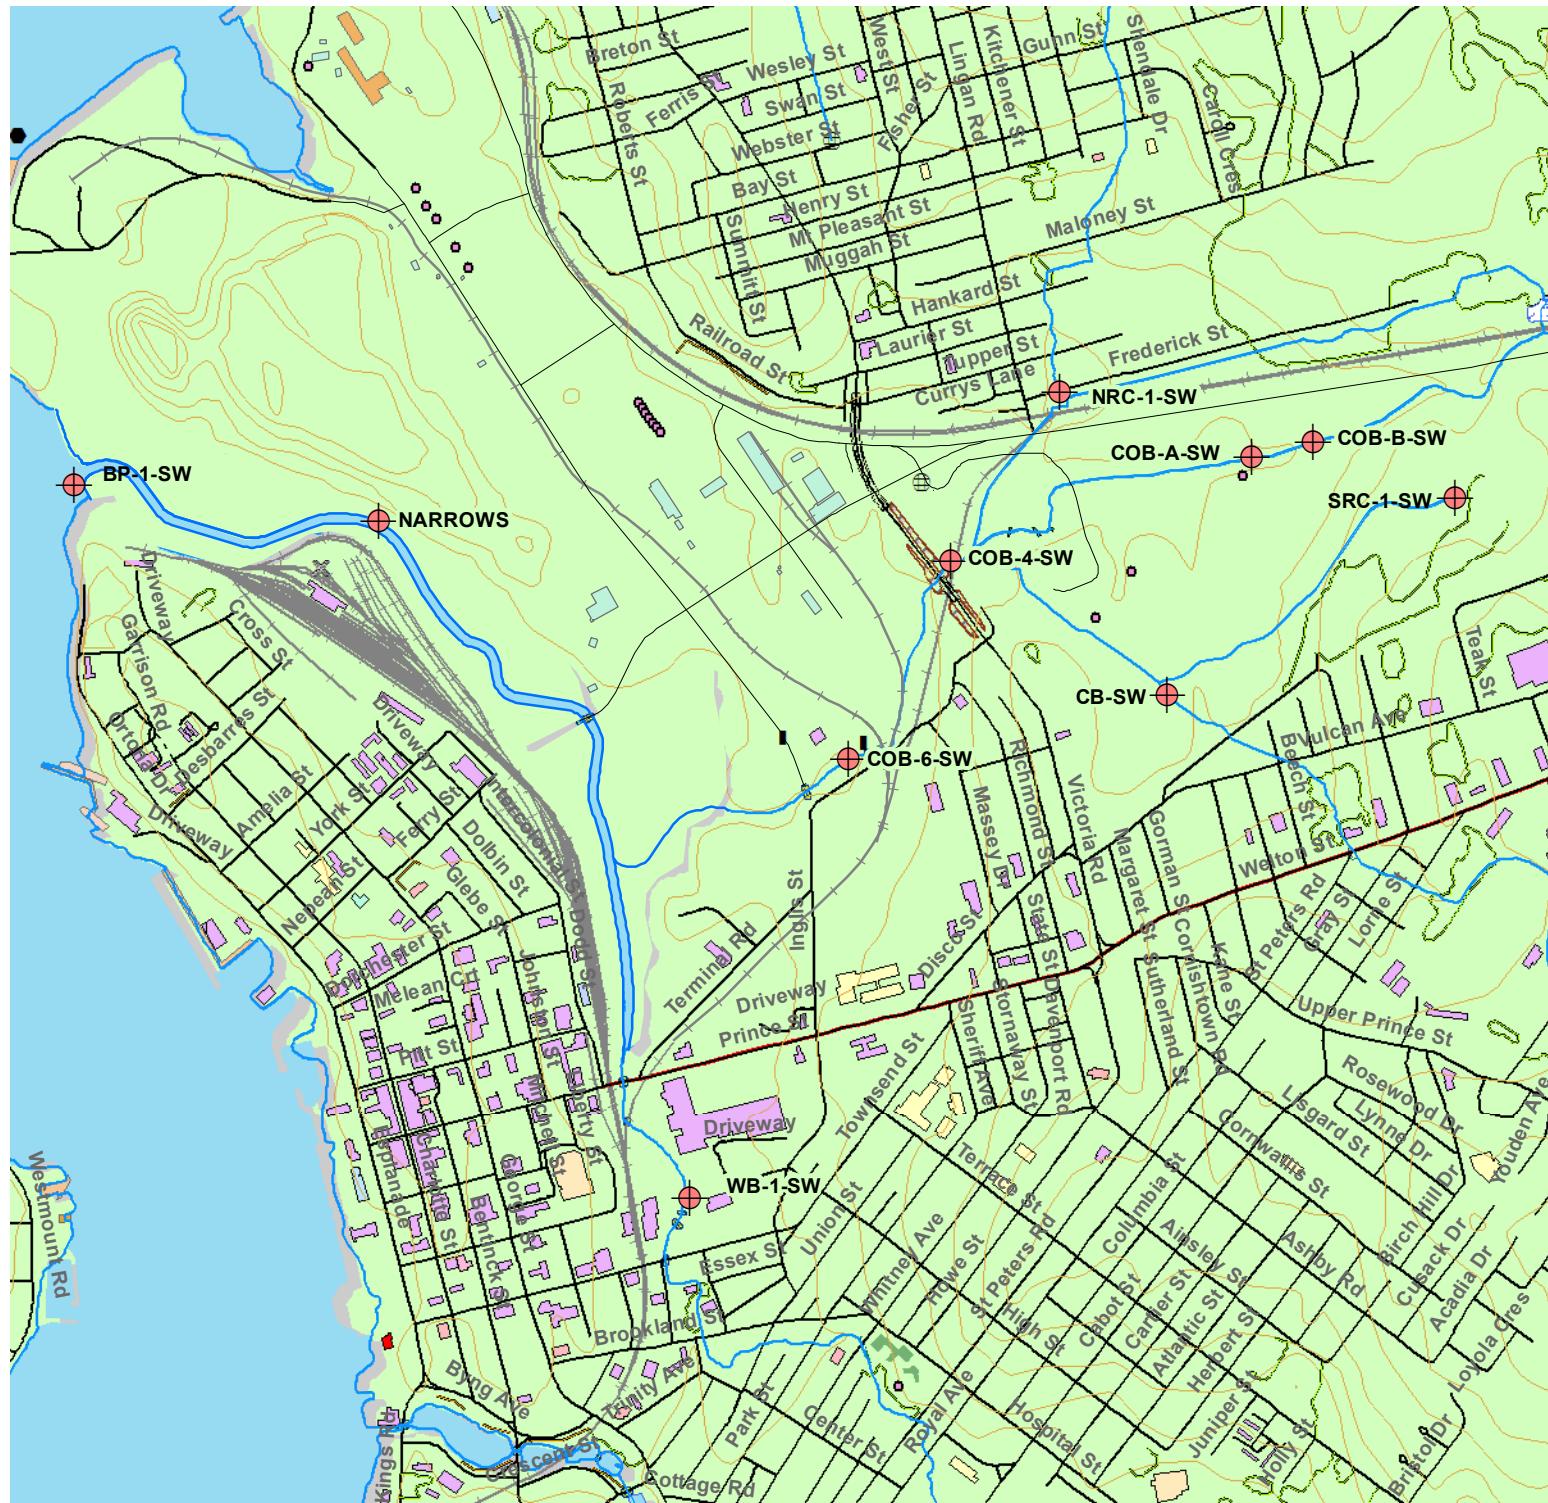

## PROJECT METHODOLOGY

The summer Surface Water Quality Monitoring program, which was completed on July 22, 2016, was scheduled to consist of the collection of surface water samples at ten stations (i.e., CB-SW, NRC-1-SW, SRC-1-SW, COB-A-SW, COB-B-SW, COB-4-SW, COB-6-SW, WB-1-SW, Narrows and BP-1-SW) (Figure 1). A GPS unit was used to confirm that the monitoring locations sampled as part of the LTMM Surface Water Quality Monitoring Program were the same as those used during historical surface water monitoring events (e.g., the Environmental Effects Monitoring and Surface Water Monitoring (EEMSWM) Program associated with the Sydney Tar Ponds remediation).

Tasks associated with the July 2016 surface water monitoring included:

- Documenting ecological activity in the surface water bodies, if observed;
- Recording of physical conditions and potential contaminants (i.e., debris, precipitate);
- Measurement of field parameters (e.g., pH, conductivity, temperature, salinity and turbidity) with a calibrated Horiba U-22 multi-probe;
- Flow calculation; and,
- Collection of surface water samples for polycyclic aromatic hydrocarbons (PAHs), general chemistry and total metals (including mercury) (RCApMS) analysis. As concentrations of petroleum hydrocarbons (PHC) and polychlorinated biphenyls (PCBs) have remained below laboratory detection limits for the duration of the LTMM program, the July 2016 surface water program was reduced to include PAH and RCApMS analysis only (following approval from Nova Scotia Environment (NSE) and NS Lands).

A summary of the surface water stations included in the July 2016 monitoring program is presented in Table 1.

Table 1 – Surface Water Quality Monitoring Stations

Monitoring Station ID	Water Body	Rationale for Sampling
CB-SW	Cagney Brook	To characterize surface water quality within the urban area of Sydney upstream of CO7/CO8 <sup>5</sup> .
NRC-1-SW	North Realigned Channel	To characterize surface water quality within the urban area of Whitney Pier upstream of CO7/CO8.
SRC-1-SW	South Realigned Channel	To characterize surface water quality related to runoff from the municipal landfill upstream of CO7/CO8.
COB-A-SW	Coke Ovens Brook - concrete riffles upstream of Stable Drive	To characterize surface water quality from runoff and leachate associated with the municipal landfill upstream of CO1 <sup>3</sup> , CO6 <sup>4</sup> and CO7/CO8.
COB-B-SW <sup>2</sup>	Coke Oven Brook along SPAR Road, east of COB-A-SW	To further characterize the potential for impacts from the municipal landfill to COB-A-SW.
COB-4-SW	COB-A-SW	To characterize surface water quality from the upstream areas of CO1, CO6 and CO7/CO8. This sampling location is also upstream of TP6B.
COB-6-SW	Coke Ovens Brook	To further characterize surface water quality from the upstream areas of CO1, CO6 and CO7/CO8. This sampling location is also upstream of TP6B.
WB-1-SW	Coke Ovens Brook	To characterize surface water quality within the urban area of Sydney upstream of TP6B <sup>6</sup> and TP7 <sup>7</sup> .
NARROWS	Wash Brook	To characterize surface water quality downgradient of the majority of the remediation sites.
BP-1-SW <sup>1</sup>	North Channel, Open Hearth Park	To further characterize surface water quality downgradient of the remediation sites and as it discharges to Sydney Harbour.

Notes:

1 The LTMM location of surface water station BP-1-SW is similar to the location used during Pre-Construction activities associated with the EEM Program and is approximately 40 meters upstream from the collection point utilized during the Construction period of the EEM Program.

2 Upstream monitoring station COB-B-SW was added to the monitoring program in 2015 to further characterize the potential for impacts from the municipal landfill to COB-A-SW.

3 CO1: Coke Oven Brook

4 CO6: Surface Cap

5 CO7/CO8: Collection System (CO7)/Water Treatment Plant (CO8)

6 TP6B: Solidification/Stabilization/Channel

7 TP7: Tar Ponds Cap

Field data was recorded on site specific data sheets. Stream flow measurements were calculated by measuring the width of the stream at the sampling location and by measuring the depth of the stream at  $\frac{1}{4}$ ,  $\frac{1}{2}$  and  $\frac{3}{4}$  width intervals. The stream flow velocity was also measured at  $\frac{1}{4}$ ,  $\frac{1}{2}$  and  $\frac{3}{4}$  intervals. Using a spreadsheet formula, the

approximate stream flow was calculated for each monitoring station. Due to the depth of surface water station BP-1-SW, it was not possible to obtain field measurements across the entire stream width. Dillon personnel collected as much field data at this deeper location as safely possible (i.e., from the stream banks/shoreline). Stream flow velocity for this location was calculated using the Muggah Creek North Channel Survey (CBCL Limited, October 2014) provided by NS Lands.

Sample containers were pre-labelled by the laboratory with the sample identification, analysis required and the project number. The date and time of sample collection were noted on the sample containers in the field at the time of collection. New nitrile gloves were worn by field staff for each sample to avoid cross-contamination between sampling stations. Samples were collected by opening the container facing upstream. Where samples were collected directly into the sample bottles containing preservative, the container was not fully submerged during sampling to avoid washing the preservative out of the container. Metals sample bottles contained nitric acid preservative to ensure that the metals remained in solution.

## WEATHER CONDITIONS

Weather information obtained from Environment Canada's climate station at the Sydney Airport indicates that accumulated precipitation for the month of July 2016 was approximately 101 millimeters (mm) of rain. Over half of the July 2016 amount of precipitation (64 mm of rain) occurred before the date of the surface water sampling event (i.e., July 22, 2016). No significant rainfall was recorded on the day of or the four days leading up to the sampling event.

## FIELD OBSERVATIONS AND MEASUREMENTS

Observations at the ten surface water stations during the July 2016 monitoring program are summarized in Table 2. Field measurements are summarized in Table 3.

Table 2 – July 2016 Surface Water Quality Monitoring Station Field Observations

Monitoring Station ID	Field Observations	Corresponding Photograph Number
CB-SW	Debris (i.e., plastic) observed on brook banks.	1
NRC-1-SW	Debris (i.e., Styrofoam, concrete, cloth, plastic, cardboard and paper) observed in the channel and on the channel banks.	2
SRC-1-SW	Algae observed in the channel. Concrete channel walls had extensive spray painted graffiti visibly dissolving at the high water point. Debris (e.g., plastic and metal) observed in the channel.	3
COB-A-SW	Stagnant/standing water, no flow. Debris (i.e., metal and plastic) observed on brook banks. Algae observed on brook rocks. Frogs observed on brook bottom.	4
COB-B-SW	Stagnant/standing water, no flow. Algae observed on brook rocks.	5

Table 2 – July 2016 Surface Water Quality Monitoring Station Field Observations

Monitoring Station ID	Field Observations	Corresponding Photograph Number
COB-4-SW	Debris (i.e., plastic and metal) observed on brook banks. Visible orange staining observed on the brook banks at the high water level point. Algae observed on brook rocks.	6
COB-6-SW	Debris (i.e., Styrofoam) observed within the brook. Algae observed on brook rocks.	7
WB-1-SW	Debris (i.e., metal, paper, cardboard and concrete) observed within the brook and on the brook banks. Minnows observed swimming in the brook. The water level was approximately 0.5 m higher than observed during previous LTMM surface water monitoring events. The higher water level may be attributed to tidal flushing.	8
NARROWS	Algae observed within the channel. Debris (i.e., plastic) observed on the channel banks. Algae observed on channel rocks.	9
BP-1-SW	Debris (i.e., glass, metal and plastic) observed on the rock banks. Algae, seaweed, snails and barnacles observed on exposed shoreline rocks. Seabirds visible in water and on shoreline.	10

Note:

Photographs are presented in Appendix A.

Table 3 – July 2016 Surface Water Quality Monitoring Station Field Measurements

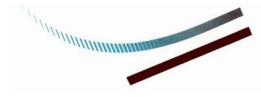

Monitoring Station ID	pH	Turbidity (NTU)	Conductivity (mS/cm)	Salinity (%)	Stream Flow 1 (m <sup>3</sup> /s)
CB-SW	8.44	3.2	0.306	0	0.012
NRC-1-SW	8.84	1.6	0.217	0	0.018
SRC-1-SW	6.95	6.6	0.069	0	0.096
COB-A-SW	Stagnant/Standing Water - No Flow				
COB-B-SW	Stagnant/Standing Water - No Flow				
COB-4-SW	8.10	0.9	0.515	0	0.048
COB-6-SW	8.96	3.3	0.541	0	0.232
WB-1-SW	8.02	4.6	0.166	0	0.469
NARROWS	7.04	7.6	68.3	1.2	2.42 <sup>3</sup>
BP-1-SW <sup>2</sup>	8.34	6.9	71.8	1.6	2.98 <sup>3</sup>

Notes:

1 Stream flow is an approximate calculated value.

2 Collected during low tide conditions.

3 As surface water stations Narrows and BP-1-SW were monitored at different times of the day, there is some difference in the calculated flow rates due to tidal fluctuation. Both locations were monitored during low tide.

## REGULATORY FRAME WORK

As specified in Section 4.2, page 21 of the NS Lands LTMM Plan, the remedial criteria used for eight of the ten surface water stations included in the LTMM monitoring program (i.e., CB-SW, NRC-1-SW, SRC-1-SW, COB-A-SW, COB-B-SW, COB-4-SW, COB-6-SW and WB-1-SW) were the Nova Scotia Contaminated Sites Regulations (NS CSRs) Tier I Environmental Quality Standards (EQS) (which came into effect July 6, 2013) for surface water (fresh water) and the Canadian Council of Ministers of the Environment (CCME) for the protection of fresh water aquatic life (FWAL), 2016. Analytical results for the remaining two surface water stations included in the monitoring program (i.e., Narrows and BP-1-SW) were compared to the NS CSRs Tier I EQS for surface water (marine) and the CCME guidelines for the protection of aquatic life (marine).

Additionally, as specified in Section 4.2, page 21 of the NS Lands LTMM Plan, analytical results for surface water samples collected at the upstream sampling stations were compared to previously calculated 95% upper confidence limits (UCL) of available Pre-Construction/Baseline analytical data from the EEMSWCM Program associated with the Sydney Tar Ponds remediation. Furthermore, analytical results for the upstream sampling stations were also compared to calculated 95% UCLs of available historical upstream analytical data (i.e., the Upstream Calculated 95% UCL). Analytical results for the two sampling stations near Sydney Harbour were compared to the calculated 95% UCLs of available Pre-Construction/Baseline analytical data for the Battery Point sampling station.

## SURFACE WATER QUALITY TREND ANALYSIS – MANN KENDALL

Mann-Kendall analysis as a non-parametric statistic test routinely used to assess the stability of solute plume (i.e., stable, decreasing, or increasing). At least four independent sampling events are required to evaluate surface water quality trends via Mann-Kendall analysis. The Mann-Kendall test procedure starts by comparing the most recent round of water quality data with the results of earlier rounds. Non-detect data values are typically assigned a value that is half the laboratory detection limit. The Mann-Kendall test is not designed to account for seasonal variation in data.

Based on a review of the analytical results from the 2016 monitoring event and historical monitoring events, select parameters , with concentrations above (or historically above) applicable guidelines were selected for Mann-Kendall analysis. These include PAH indicator parameters anthracene, pyrene and benzo(a)pyrene and inorganic chemistry indicator parameters boron, cadmium, strontium, sulphate and zinc.

In certain situations, Mann-Kendall analysis results may be biased due to elevated laboratory detection limits. Non-detected data on the Mann-Kendall analysis of indicator parameters was identified and confirmed the influence of non-detected data is minimal.

## SURFACE WATER RESULTS

The surface water quality results for the July 2016 event, and available post-remediation surface water data, are presented in the attached Tables B-1 and B-2 in Appendix B. As stated above, surface water samples were analyzed for PAHs and RCAPMS. Samples were delivered to Maxxam Analytics in Sydney, Nova Scotia (Maxxam) who are contracted directly by NS Lands to conduct the sample analysis. Maxxam is a Canadian Association for Laboratory Accreditation (CALA) certified laboratory for the parameters analyzed. Review of the data indicates:

### PAH results:

- o The anthracene concentration of 0.021 ug/L in NRC-1-SW exceeded the Tier I EQS (fresh water) and CCME FWAL guideline of 0.012 ug/L;
- o Benzo(a)pyrene concentration of 0.025 ug/L in WB-1-SW exceeded the Tier I EQS (fresh water) and CCME FWAL guideline of 0.015 ug/L;
- o Fluoranthene concentration of 0.16 ug/L in WB-1-SW exceeded the Tier I EQS (fresh water) and CCME FWAL guideline of 0.04 ug/L; and,
- o Pyrene concentration of 0.092 ug/L in WB-1-SW exceeded the Tier I EQS (fresh water) and CCME FWAL guideline of 0.025 ug/L.

The remaining PAH parameters analyzed were below criteria. A summary of concentrations of select organic parameters (i.e., PAHs) at each station recorded during the July 2016 event relative to the calculated 95% UCLs is provided in Table 4.

### General chemistry and metals results:

- o Concentrations of aluminum ranging from 31 ug/L to 87 ug/L exceed the Tier I EQS (fresh water) standard of 5 ug/L in CB-SW, NRC-1-SW, SRC-1-SW, COB-4-SW, COB-6-SW and WB-1-SW;
- o The arsenic concentration of 1.9 ug/L in SRC-1-SW is above the Upstream Calculated 95% UCL of 1.6 ug/L;
- o The boron concentrations of 3600 ug/L and 3500 ug/L in BP-1-SW and the Narrows exceeded the Tier I EQS (marine water) standard of 1200 ug/L;
- o Concentrations of cadmium ranging from 0.016 ug/L to 0.035 ug/L at NRC-1-SW, SRC-1-SW and WB-1-SW exceed the Tier I EQS (fresh water) standard of 0.01 ug/L;
- o Iron concentrations ranging from 310 ug/L to 970 ug/L in CB-SW, NRC-1-SW, SRC-1-SW, COB-4-SW and WB-1-SW exceed the Tier I EQS (fresh water) and CCME FWAL guideline of 300 ug/L;
- o Manganese concentrations of 71 ug/L and 120 ug/L at BP-1-SW and the Narrows, respectively, are above the Battery Point/Narrows Calculated 95% UCL;

## Notes:

<sup>1</sup>Pre-Construction/Baseline Calculated 95% UCLare from the EEMSWCM Program

<sup>2</sup> Added to the program in July 2015

NS indicates that the surface water station was not sampled as it was either dry or had stagnant/standing water with no flow

**Bold** indicates the concentration exceeds the Pre-Construction/Baseline Calculated 95% UCL

- o Concentrations of strontium ranging from 160 ug/L to 1,300 ug/L are above the Upstream 95% UCL of 132 ug/L at CB-SW, SRC-1-SW, COB-4-SW, COB-6-SW and WB-1-SW. The concentrations at COB-4-SW, COB-6-SW and WB-1-SW also exceed the Pre-Construction/Baseline 95% UCL of 210 ug/L;
- o Sulphate concentrations ranging from 51 ug/L to 410 ug/L at SRC-1-SW, COB-4-SW, COB-6-SW and WB-1-SW exceed the Upstream Calculated 95% UCL. The concentration of 410 ug/L at WB-1-SW also exceeds the Pre-Construction/Baseline Calculated 95% UCL; and,
- o The chloride concentration of 2900 mg/L at WB-1-SW exceeded the CCME (FWAL) guideline of 120 mg/L.

The remaining general chemistry parameters were below applicable criteria. Table 5 provides a summary of concentrations for select inorganic parameters from the July 2016 sampling event relative to the calculated 95% UCLs.

## TREND ANALYSIS

The groundwater quality trend analysis for the 2016 monitoring event was based on the available analytical results (i.e., four rounds of sampling events are required) for select parameters, including PAH indicator parameters anthracene, pyrene and benzo(a)pyrene and inorganic chemistry indicator parameters boron, cadmium, strontium, sulphate and zinc. Concentrations of boron and sulphate at surface water station WB-1-SW showed a fluctuating trend. Trend analysis results for the remaining parameters and surface water stations indicated fluctuations with no trend or a generally declining trend.

## QUALITY CONTROL PROCESS

One field duplicate of sample, COB-4-SW, and one trip blank were collected during the July 2016 monitoring event. The relative percent difference (RPD) was calculated between the sample and associated field duplicate results. The RPD was not calculated for those parameters where one or both of the results associated with the original and/or field duplicate sample exhibited concentrations less than five times the laboratory reportable detection limit (RDL). The calculated RPDs were within established limits (i.e., less than 30% RPD) for each parameter with the exception of %ion balance and aluminum. PAH compounds were not detected in the trip blank. There were no holding time exceedances.

The laboratory analytical certificates have been reviewed for quality assurance/quality control purposes. The laboratory completed quality control analysis including duplicates, blanks, spikes, surrogate recoveries and spiked blanks to assess accuracy and precision as well as the potential for bias, contamination and degradation or matrix effects. No issues were found with the laboratory quality control reports.

Table 5 – Summary of Inorganic Surface Water Indicator Parameter Concentrations relative to Calculated 95% UCLs

Notes:

<sup>1</sup>Upstream, Pre-Construction/Baseline and Battery Point/Narrows Calculated 95% UCLs are from the EEMSWCM Program

<sup>2</sup>Added to the program in July 2015

NS indicates that the surface water station was not sampled as it was either dry or had stagnant/standing water with no flow

**Bold** indicates the concentration exceeds the Upstream Calculated 95% UCL

Underline indicates exceedance of the Pre-Construction/Baseline Calculated 95% UCL

*Italics Bold* indicates exceedance of the Battery Point/Narrows Calculated 95% UCL

*Italics* indicates that the laboratory detection limit is greater than the comparison criteria

## SUMMARY

Analytical results of the July 2016 surface water monitoring program indicate that concentrations of the majority of the analyzed parameters are below the applicable criteria and respective 95% UCLs. Criteria and 95% UCL exceedances are summarized in Table 6.

Table 6 Summary of Surface Water Station Criteria and 95 % UCL Exceedances July 2016

Parameter	Location (Criteria and/or 95% UCL Exceedance)

The PAH exceedances (i.e., benzo(a)pyrene, fluoranthene and pyrene) observed in WB-1-SW during the July 2016 monitoring program were the first PAH exceedances reported for this surface water station since the LTMM program commenced in December 2014. Additionally, the significant increases of cadmium, chloride, strontium and sulphate at WB-1-SW are the first exceedances, and the highest concentrations, of these parameters observed since July 2013 (pre-LTMM). The increased concentrations at surface water station WB-1-SW may be attributed to tidal flushing. During the field program, the water level at WB-1-SW was observed to be approximately 0.5 m higher than that recorded during previous LTMM monitoring events. Concentrations of anthracene at NRC-1-SW have been elevated (i.e., above criteria) since the November 2015 monitoring program. Prior to November 2015, the anthracene concentration at NRC-1-SW was below laboratory detection limits.

#### HARBOURSIDE EAST (HE) TREATMENT PLANT DISCHARGE DATA

At the request of NS Lands, Dillon undertook a preliminary review of the HE treatment plant discharge data in comparison to the LTMM surface water station data. The preliminary review was undertaken to evaluate if there is apparent variability resulting in an improvement of down gradient surface water bodies included in the LTMM sampling program.

Review of the data indicates that surface water chemical parameter concentrations across the site are relatively consistent in that the concentrations are generally low (typical of fresh water), have similar parameters detected, contain a significant amount of variability due to the low concentrations (laboratory variability is highest at low concentrations) and the potential influence of sediment (each of the surface water

sample locations have variable iron, aluminum, and to a lesser extent zinc concentrations that have varied by as much as an order of magnitude during the monitoring period of 2013 to 2016, which is indicative of suspended sediment influence). It is also noted that there are potential tidal influences evident at the WB-1-SW, BP-1-SW and Narrows locations, as indicated by the elevated chloride, sulphate and total dissolved solids (TDS) observed at these locations.

The chemical composition of the effluent from the treatment plant in July 2016 is chemically similar to the surface water samples for the metals parameters with detectable concentrations in the effluent (i.e., aluminum, zinc) and, like the surface water locations, the effluent has no detectable concentrations of PCBs or PHCs. The majority of trace metals were either non-detect before treatment or were reduced to not detectable concentrations post treatment and as such cannot be compared to the surface water concentrations. Although the effluent samples do not include the analysis of as many general chemistry parameters (i.e., effluent results did not include chloride, sulphate, alkalinity, nitrate, phosphate, sodium potassium, calcium, magnesium etc.), the pH and hardness are chemically similar to the pH and hardness of the surface water samples, with the exception of tidally influenced WB-1-SW, BP-1-SW, and Narrows locations (see Table B-3 in Appendix B).

Given the generally low concentrations, consistent chemical character and high degree of variability associated with the surface water samples (many parameters being below detection), it is not possible to determine, with any significance, whether or not the changes in the treatment plant operation, and resulting effluent, is having any measureable impact on the surface waters. The effluent is too similar in chemical character for detectable parameters to the surface water and the high degree of variability present in the low concentrations of most parameters mask any potential differences that may exist.

Review of previous results indicates similar degrees of fluctuation, detectable parameters and low concentrations. Further comparison of effluent quality to surface water quality would unlikely result in any measureable differences beyond the inherent laboratory fluctuations at low concentrations and sediment influence; therefore, no further assessment is recommended.

## RECOMMENDATIONS

The next surface water monitoring event will be conducted in the fall (i.e., November 2016). It is recommended that Fall 2016 sampling program include the collection of surface water samples at ten stations (i.e., CB-SW, NRC-1-SW, SRC-1-SW, COB-A-SW, COB-B-SW, COB-4-SW, COB-6-SW, WB-1-SW, Narrows and BP-1-SW) for PAH and RCAPMS analysis.

## DISCLAIMER

This report was prepared exclusively for the purposes, project and site location outlined in the report. The report is based on information provided to, or obtained by Dillon Consulting Limited ("Dillon") as indicated in the report, and applies solely to site conditions existing at the time of the site investigation. Although a reasonable investigation was conducted by Dillon, Dillon's investigation was by no means exhaustive and cannot be construed as a certification of the absence of any contaminants from the site. Rather, Dillon's report represents a reasonable review of available information within an agreed work scope, schedule and budget. It is therefore possible that currently unrecognized contamination or potentially hazardous materials may exist at the site, and that the levels of contamination or hazardous materials may vary across the site. Further review and updating of the report may be required as local and site conditions, and the regulatory and planning frameworks, change over time.

## CLOSING

We trust this information is adequate for your needs. Please, however, contact the undersigned if you have any comments or questions regarding the content of this report.

Yours truly,

DILLON CONSULTING LIMITED

**CERTIFICATE OF ANALYSIS**

**MAXXAM JOB #: B6F5932**

**Received: 2016/07/22, 17:00**

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

\* RPDS calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Bedford

(2) The APHA Standard Method require pH to be analyzed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the APHA Standard Method holding time.

(3) TOC / DOC present in the sample should be considered as non-purgeable TOC / DOC.

**Encryption Key**

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

#### **GENERAL COMMENTS**

Sample CTS233-01 : Elevated reporting limits for trace metals due to sample matrix.

Poor RCAP Ion Balance due to sample matrix.

Sample CTS236-01 : Elevated reporting limits for trace metals due to sample matrix.

**Results relate only to the items tested.**

### QUALITY ASSURANCE REPORT(CONT'D)

QA/QC				Date					
Batch	Init	QC Type	Parameter	Analyzed	Value	Recovery	UNITS	QC Limits	
4599588	SMT	RPD	Total Organic Carbon (C)	2016/07/29	14		%	20	

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

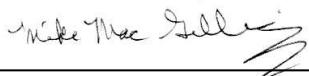

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

### **VALIDATION SIGNATURE PAGE**

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Mike MacGillivray, Scientific Specialist (Inorganics)

Rosemarie MacDonald, Scientific Specialist (Organics)

---

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.
